الموضوع:

$$1) y = w^T X + b$$
$$y_1 = 2(2) - (4) + 0.5 = 0.5$$
$$y_2 = 2(4) - (2) + 0.5 = 6.5$$
$$y_3 = 2(2) - (2) + 0.5 = 2.5$$

Perceptron is linear, can't capture complex patterns

2) 18 neurons, 4 hidden layers, 40 parameters
(assuming)

$$3) [0, 3, 4, 6, 3, 2, 3, 4, 0] * [1, 2, -1] =$$
$$[2, 5, 13, 10, 4, 4, 11]$$

$$4) \text{Length} = L - F + 1 + 2P \quad -F + 1 + 2P = 0$$

on each side $\leftarrow P = \frac{F-1}{2}$

$$5) \begin{bmatrix} 8 & 19 & 1 \\ 13 & 1 & 16 \\ -10 & 28 & 20 \end{bmatrix}$$
